

THE WRONG AI QUESTION

AI DOESN'T DESTROY JOBS. IT DESTROYS SKILLS.

What work actually loses when technology improves.

01

The wrong unit of analysis

Headlines count jobs. Technology usually changes the tasks and skills inside them first. That is where the advantage moves.

RUSSELL'S POINT

Technology doesn't destroy jobs.
It democratises work by destroying skills.

02

One job. A different gate.

Shipyard work once required the strength to wield heavy tools for hours. An exoskeleton makes the tool almost weightless.

WHAT CHANGED

The job stayed. Physical strength stopped being the price of entry.

Access expands. Uniqueness shrinks.

The worker is safer. The employer gains a wider talent pool. But the skill that once made one person employable is no longer scarce.

THE CAREER QUESTION

What can the tool now do well enough for anyone?

01

Creativity and story

See the hidden meaning. Turn data into a clear story. Help other people understand, care and move.

THE SHIFT

The scarce skill is not producing more.
It is seeing and expressing what matters.

Self-efficacy

Keep learning. Develop your resilience. Take responsibility for your career before the old advantage disappears.

THE QUESTION

How much of your lifetime learning budget did you spend before 24?

Leadership

The people and leadership gap is forecast to sit just behind technology by 2030.

WHY IT MATTERS

A manager can affect your mental health as much as your partner.

DO

What do you think?

Use AI to elevate your thinking, not substitute it. If you need time to work out your opinion, create it.

DO THIS NEXT

Name the skill AI has made easier in your role.
Then name what only you can add.
